

Are you ready for an air conditioning inspection?

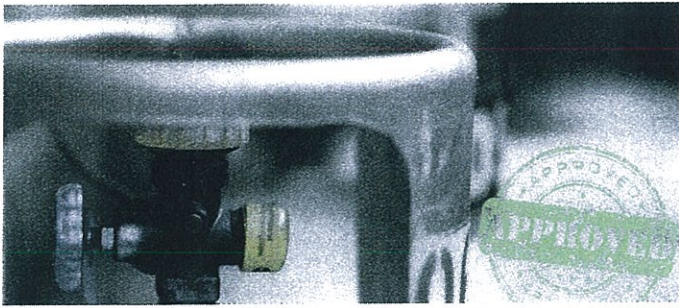

If you have an air conditioning system that is over 12kw then you have just three months to have your air conditioning inspected.

As part of the EPBD (Energy Performance of Buildings Directive), air conditioning units over 250kw already require an air conditioning inspection, but legislation that comes into force on January 1st means that units over 12kw will also be included. These inspections will help clients save energy and money over time.

Cavendish Engineers is an independent consultancy that provides low carbon solutions and energy management.

This year Cavendish Engineers and its subsidiary company DX Electrica, will be exhibiting on stand G90 at the Energy Solutions Expo at London Olympia on the 6th and 7th October. They will be offering advice and trade show discounts on their air conditioning inspection services. For details on this legislation and special offers on their air conditioning maintenance please visit www.dxelectrica.net. Energy Solutions Expo, stand G90

SANDTEX TRADE 365 RISES TO THE CHALLENGE

The unique qualities of Sandtex Trade 365 worked against the clock to tackle a tall order, enabling an entire lighthouse to be painted from top to bottom in less than a week - while delivering a protective finish for the long term.

Section scheme manager at Sunderland City Council, Peter McQuillan, and his maintenance team oversaw the painting works at the grade II listed building - the UK's only surviving metal lighthouse.

McQuillan had to specify the most appropriate decorative coating system to preserve and protect the landmark structure.

Sandtex Trade 365 is recognised for its ability to work at low temperatures and in humid conditions, making it the ideal choice for ambient weather conditions.

The maintenance team applied a preparatory coat of Sandtex Trade Rust Inhibiting Primer to protect against corrosion and provide a sound base. This was followed by a coat of Sandtex Trade 365 Primer Undercoat and the system was completed with a single coat of Sandtex 365 All Weather Gloss.

A cool touch tap for safer hospitals

Safetherm, Rada's new thermostatic mixer tap for healthcare environments, sets new standards in safety, ease of use and serviceability.

Safetherm features 'Insutech+ Technology', which reduces surface temperatures on the hot inlet to a safe level. This answers growing health sector concerns about accidental contact burns, particularly children and the elderly grabbing the body of a hot tap.
