

Calibration

To set up the showerdrop, press and hold both the droplet buttons on your showerdrop. After 2 seconds the clock display will start flashing as zeros. You are now ready to calibrate your Showerdrop.

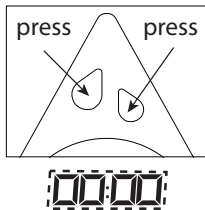

Turn on your shower and when you are ready press the large droplet button **at the same time** as you start to fill the container. When the water has reached the one litre mark press the big button again. If you're happy with the accuracy, wait a few seconds until the clock reappears.

The Showerdrop is now calibrated to measure your own particular shower.

If you're not happy and think your set-up was inaccurate, then simply reset the process by pressing both droplet buttons until the clock display flashes as zeros. You can then repeat the procedure above to set up the Showerdrop

Remember the more accurate the calibration, the more accurate the Showerdrop will be.

That's it. You don't need to reset the Showerdrop again unless you use a different shower or change the batteries.

Using the Showerdrop

When you take a shower, start the Showerdrop by pressing the big droplet button when you turn the shower on. The display will then show the number of litres dispensed and the illustrated figure filling up. When the figure is full, which equates to 35 litres, an audible alert sounds. **35 litres is the amount of water recommended for a shower by UK water authorities*.**

To turn the Showerdrop off, simply press the big button again and the display stops, showing the amount of water you've used. If you carry on showering, or forget to turn it off, the display continues to show the litres dispensed up to a maximum of 99 litres, when it will stop automatically.

The Showerdrop resets itself automatically after approximately 5 seconds, ready for your next shower.

*Waterwise

The Eco Showerdrop has been awarded the prestigious Marque by Waterwise, the leading authority on water efficiency.
